Combat is dangerous enough without having to worry about being shot at by someone on your own side. That’s why your vehicle needs combat identification panels (CIPs).

What are CIPs?

CIPs are the ground-to-ground component of the Joint Combat Identification Marking System (JCIMS) and are composed of 24x30-in panels covered with a special thermal tape. When mounted on the front, back and sides of a vehicle, the panels are seen as a unique contrasting “cold spot” when viewed through a thermal-imaging device.

CIPs measure 24 x 30 inches

Panels will appear as “cold spot” through thermal viewer

Gunners that are trained to recognize these unique signatures can tell if the vehicle in their sights is friendly or unknown.

The panels mount to the vehicle using bolts, hook-and-pile tape, or mounting frames. The back side is painted with CARC, so you can turn the system on or off by simply turning the panels around.

How Do You Get CIPs?

CIPs are being fielded as free-issue items to units deploying in support of OIF/OEF. If you’re deploying and haven’t received the panels, call the Office of the Product Manager for Target Identification and Meteorological Sensors (PM TIMS) at DSN 987-5324 or (732) 427-5324.

During fielding, units will also receive a compact disk set, *Combat Identification Panels Kit Installation*. This two-CD set provides detailed video on how to install, use, maintain and clean the CIPs. It also includes thermal images of specific vehicles and printable versions of the combat vehicle mounting instructions.

**Before Operation**
- Eyeball the CIPs to make sure they’re securely attached to the vehicle. If you see bends in the CIP brackets, try to straighten them. Report panels that are missing or can’t be repaired.
- Check the painted surface of the panels for damage. Spot paint with CARC if needed, but never paint over the thermal tape.
- Inspect the panel for loose, missing or peeling thermal tape. Loose tape should be repaired using adhesive, NSN 8040-00-938-6860. Replace damaged or missing tape with NSN 8135-01-518-2504. That NSN brings a 150-ft roll of brown self-adhering thermal tape.
- Keep the panels clear of dirt, dust, mud and sand. Use a soft, clean cloth to wipe off the panels. If the tape’s dirty, you won’t project a good image—in more ways than one.
- If the panels are mounted using hook-and-pile tape, make sure the tape is securely attached to the vehicle. The tape should also be clean and free of debris.

**During Operation**
- When operational conditions allow, make the following checks:
  - Report any missing or damaged CIPs.
  - Glue down any loose tape.
  - Replace any missing thermal tape.
  - Wipe the panels with a soft, clean cloth. The panels will need cleaning more often in dusty environments to ensure a strong thermal signature.

**After Operation**
- Report any missing or damaged CIPs.
- Repair minor damage to the brackets, panels or panel inserts.
- Glue down any loose thermal tape.
- Replace any missing or damaged thermal tape or hook-and-pile tape.
- Remove the panels before washing your vehicle. High-pressure water can peel off the thermal tape or knock off and damage the panels.
- Wash both sides of the CIPs with low-pressure water. Then dry them with a soft, clean cloth.
- Reverse the panels so the CARC side faces out.

**More Info**
More information on CIP replacement and replenishment for panel kits, components, and tape is available through the CIP item manager at TACOM. Call DSN 786-6989 or (586) 574-6989.
